- Author authority: 3/10. The name is consistent, but there's no bio depth, no profile links, and the off-site links are searches.

The foundation is solid: titles are in good shape, book page titles are about 52 characters, the cover alts are descriptive, and the internal linking is clean. The gaps are depth of content, entity signals, and structured data.

If you share the source (it looks like static HTML plus `assets/site.js`), I can write the JSON-LD, `robots.txt`, `sitemap.xml`, `llms.txt`, an expanded About page and book-page FAQ blocks directly.

systems weight named, verifiable authors heavily, and this page is the entity anchor for "Alys Thorne". Fix: 250–400 words covering who she is, the trilogy, her influences, her publishing path (indie or traditional), and links to Goodreads, Amazon Author Central, BookBub and so on.

3. **Book pages have almost no extractable content.** Blood Awakens has about 100 words, which is just the blurb repeated from the homepage. Fix: add release date, page count, format and ISBN, series reading order, tropes, content warnings, a short FAQ, and reader quotes or reviews. A book page is the one most likely to rank and get cited, so it should be your richest page.
4. **Author and off-site links go to searches, not profiles.** "Amazon" and "Goodreads" in the footer and header point to search-result URLs. These are weak entity signals and useless as `sameAs` targets. Fix: link to your Amazon Author Central page and your Goodreads author profile.

Important Improvements

1. **Add Book/Person structured data (verify what exists first).** I couldn't see any JSON-LD. The set to add: `Person` (Alys Thorne) and `WebSite` on the homepage, `BookSeries` for Veins of Silver, and `Book` on each book page with `author`, `position` in the series, `isbn`, `datePublished`, and `offers` to the Amazon URL. Add `BreadcrumbList` too, since the pages already show a Home / Books / Title trail.
2. **Custom domain.** `*.vercel.app` is a weak brand signal for an author. A domain like `alysthorne.com` helps rankings, trust, entity consistency and sharing. Redirect the vercel.app URL to it once it's live.
3. **Internal links use `.html`, but the pages resolve to clean URLs.** For example `/about.html` ends up at `/about`. Update internal links, canonicals and sitemap entries to the clean version so you don't split signals or add redirect hops.
4. **Homepage meta description is about 170 characters.** It will truncate. Trim it to 150–160 and end on a CTA, for example "…Start the Veins of Silver trilogy today."
5. **The About description duplicates the homepage's first sentence.** Give each page its own description, and add a CTA to About.
6. **`og:type` is `website` on book pages.** Switch to `book` there, and `profile` on About.
7. **The homepage H1 is a brand name plus tagline fused together.** That's fine as a design choice, but add a plain-language sentence near the top that states what this is, for example "Alys Thorne is the author of Veins of Silver, a dark romantic fantasy trilogy about…". That's the definitional pattern AI answers lift directly.
8. **Hover-only content.** "Hover to learn who they were" hides content on touch devices. Make sure the character details are in the HTML and visible without hover.
9. **The game lives on a separate domain (`veins-android.vercel.app`).** That splits authority. Keep an indexable `/game` page here with a real description, and link out for the play button.

Quick Wins

1. **Add a 5–8 question FAQ to the books page**, written the way people ask AI assistants: "What order should I read Veins of Silver?", "Is Veins of Silver finished?", "Is it on Kindle Unlimited?", "What tropes does it have?".
2. **Put the trope and genre phrases readers actually search for into visible copy** (forbidden

2. **Put the trope and genre phrases readers actually search for into visible copy** (forbidden love, enemies-to-lovers, vampire romance). If it's accurate for the series, a term like "sapphic vampire romance" is likely a high-intent query.
3. **Add visible "Last updated" dates** and a small news or updates section. Without it, nothing signals freshness.
4. **Add alt text that does more than name the cover.** Your cover alts are good, but the character and lore images need the same treatment.
5. **Create `/llms.txt`** with a series summary, reading order, and 5–6 question-and-answer pairs.
6. **Register in Bing Webmaster Tools and Google Search Console.** ChatGPT and Copilot lean on Bing's index.

Verify (couldn't check from here)

- `robots.txt` allows GPTBot, OAI-SearchBot, ClaudeBot, PerplexityBot and Googlebot, and lists the sitemap.
- `sitemap.xml` exists, uses clean URLs, and has real `lastmod` dates.
- Every page has a self-referencing `<link rel="canonical">`, plus `og:image` (1200×630) and `twitter:card`.
- Images are WebP (they appear to be), and the hero is not render-blocking.
- Non-existent URLs return a real 404.

GEO Readiness Score: 4/10 (provisional)

- Content structure: 4/10. Clean headings and strong taglines, but thin, with no passages that stand alone.
- Schema markup: unverified, assume 2/10 until confirmed.
- AI crawler access: unverified. It's a static site, which is a good sign for rendering.
- Content freshness: 2/10. No dates anywhere.
- Author authority: 3/10. The name is consistent, but there's no bio depth, no profile links, and the off-site links are searches.

The foundation is solid: titles are in good shape, book page titles are about 52 characters, the cover alts are descriptive, and the internal linking is clean. The gaps are depth of content, entity signals, and structured data.

If you share the source (it looks like static HTML plus `assets/site.js`), I can write the JSON-LD, `robots.txt`, `sitemap.xml`, `llms.txt`, an expanded About page and book-page FAQ blocks directly.
